We are beginning to forget who we are.
Explorers, discoverers, not shrews. "Interstellar", 2014

Look at the stars

The starry sky, strewn with millions of luminaries, whose bizarre figures are scattered across the entire sky, is one of those spectacles of nature that can really make us stop and think about the infinity of the Universe, about our origin, about the world around us, which seems so distant, but at the same time tangible and close.

It is naive to elevate the telescope to the status of a magic instrument that reveals all the secrets of the universe, because it is just a man-made device. And yet it is the telescope that can help us lift the veil of mystery over the starry sky, see mysterious nebulae, globular clusters, distant galaxies...

Introduction to Astrophotography

Anyone who has ever observed through a telescope has had the desire to take beautiful photographs of what they saw. Many of the stunningly beautiful and detailed photographs that can be seen in books or found on the Internet were taken by amateurs using relatively modest equipment...

More

Astrophotography of the planets of the Solar System

In regular art photography, every more or less professional photographer selects equipment before shooting depending on the subject. A beginner amateur of astrophotography should do almost the same...

Ask about watching the stars

What accessories do I need?

The accessories that you absolutely need will depend on what you would like to observe. But as a general rule, where useful equipment is concerned, it is advisable to start with eyepieces.

Which questions do I need to ask myself in order to find the right telescope?

5 questions that you should definitely ask yourself before buying a telescope

Is it difficult to get started as a hobby astronomer, or can I simply give it a try?

The answer to this question is very clear: you can simply give it a try. There's virtually nothing easier than pointing a telescope at the sky and looking through it.

Which telescopes are suitable for children and adolescents?

With the Omegon N76/300, children from the age of six upwards can enjoy astronomy adventures, and take a look at the Moon before going to bed.

What can I observe with a telescope, and what can't I?

This varies a little depending on the size of the telescope and therefore also the performance.
